VII. Social Organization

1. General

619

In the case of the Surára and the Pakidái, these are sovereign tribes, who, however, live together in connubium. The same extends to the friendly Xiriána /Shiriana/, Puseheweteri, Aramamesteri, etc.

[164]
[165]
[726]

Although the Indians investigated by me have very little contact with palm-fiber gatherers or the personnel of the Indian protection post Ajuricaba on the Demini, their population is steadily decreasing for the following reasons: birth control; high infant mortality as a result of the lack of hygiene; diseases, chiefly measles epidemics (312), but also chicken pox and grippe;

> 312. In 1952/53, for example, a measles epidemic spread like a wave from the lower Amazonas as far as the Brazilian-Colombian border area and brought death to many Indians. (Statement by Herr Alipio Edmundo Lage, Inspector of la. Inspetoria do Serviço de Proteção aos Índios, Manaus).

[115]

and frequent wars (313).

> 313. On the occasion of an attack on a hostile maloka, an attempt is made to kill all the men, young men, and boys, insofar as possible, while the women and girls are taken along as captives.

2. Names

551
162
[160]

The exact number of Surára at the time of my stay among them amounted to only 64 (314) and consisted of the following:

[114]

> 314. In the first reports of my investigations I erroneously gave the number as 42 (Becher, 1957a, p. 118; Becher, 1958, p. 157).

/62 cont./

4. Life Cycle

842 862 [163] [165] a) Birth control

The number of children among both the Surára and the Pakidái is very small; no woman has more than three at most. Aside from the high infant mortality rate as a result of the lack of hygiene, however, this is bound up with the fact that the women must observe an interval of at least three years after each birth, as long as a child is fed with mother's milk, which, in the opinion of these Indians, prevents conception to a considerable extent. If a woman nevertheless becomes pregnant, the medicine men know how to prepare an abortive medicine from plant juices. The reason for birth control, I was told, is that if a child were born during the period of restriction, it would not be healthy and able to cope with life, because the mother's body would still be too weak.

842 847

843 b) Food taboos during pregnancy

Before the birth the mother must observe many food taboos in order not to harm her child. Her diet then consists primarily of the tender meat of the mutum (Crax sp.), cooked bananas, manioc flat-cakes, and a drink that is made from the nourishing, very oily pupunha fruits. If she were to eat wild-pig meat, for example, the child would be born dead; the meat of the pirarucu (Osteoglossidae, the largest fresh-water fish), which carries inside it the bad breath of the river, would make it blind, and parrot meat would make it cry constantly later on.

844 c) Birth

While giving birth, the woman kneels in front of a tree and embraces the trunk with both arms. The ground has been sprinkled with water beforehand so that it is slimy and soft. Several female members of the tribe assist the woman in labor. After the birth, two women, each with a cotton thread, tie off the umbilical cord, and a third one then bites it off. The father

Surara
Pakidai

/62 cont./ The father
844 of the child later hangs it on the tip of a pupunha palm
[824] (Guilielma speciosa Mart.), which is connected with fertility
[842] magic; he buries the afterbirth in the planting. Two confinements which I was able to observe were very easy and quick.
[142] On the lower part of the children's back I could see in each case the grayish-black spots of pigment, the so-called Mongolian spots.

844 Immediately after birth, the mother with her baby took a
846 bath at the nearby riverbank and then lay down in her hammock for one or two hours. After that, with the baby on her arm, she already went back to her customary occupation.

845 If a complication arises during confinement, the chief, who
[622] is at the same time the witch doctor, is fetched.
[756] In contrast to most other Indian tribes, twins are reared.
845 If there should be triplets, which so far has never occurred, one
847 child would have to be killed, for, as they said, the mother has only two breasts. Deformed children are killed and thrown into the river.

852 There are no birth ceremonies, for up to its third year of
851 life the child belongs to the flesh and blood of its mother and
553 is not given a name before this.

854 d) Infancy and early childhood

The infant or young child is not left alone for a moment. When the mother attends to her housework or gathers fruits and berries in the forest, she carries it in a carrying band of tree bast on her left hip, so that she has the right hand free for her work.
853 Even at night it sleeps with her in the hammock. The breast is constantly at its disposal, so that it never /63/ thinks of sucking its finger. This may perhaps also explain why these Indians have such a perfect set of teeth. As soon as the teeth start coming in, the child is given tough meat to chew on, in order to facilitate teething. At the same time the long period of nursing, along with abundant sunshine, prevents rickets. After 3-4 months the baby is given supplementary food in the form of cooked, green mealy bananas (Musa paradisiaca normalis), which are prechewed by the mother, or a porridge made out of manioc flat-cakes.

854 514 [123] /64 cont./ If the child's nose is not clean, the mother carefully takes it between her teeth, presses its contents into her mouth, and spits them out. The women found it most unhygienic that I blew my nose into a handkerchief and carried it with me.

856 593 The little Surára and Pakidái learn to walk and talk at the same age as the children of civilization, and they are aided by their parents, siblings, and relatives. The pleasure of the relatives is great and they are overjoyed when the child is able to stand and walk and babble its first words, nápe=mother and hápe=father.

862 e) Name-giving

After the completion of the third year, a new, important period of life begins. The nursing period is ended, and the child, [851] which hitherto belonged to the flesh and blood of the mother (325b), has become an independent human being.

851 846 114 171 842 325b. This idea is very unusual for South American Indians. It should be remembered, however, that among most of the tribes the so-called couvade, the men's childbed, is practiced. Karl von den Steinen, who has examined the psychological basis of this custom, says that in this case the child, whether it be a boy or girl, is "the little father," so to speak, a part of the father, that is, a bit of his body. (K. von den Steinen, 1894, pp. 334 ff.) "The activity of the mother in this connection is compared to that of the soil, which receives the seed." (von Spix and von Martius, 1831, p. 1339.)

000 553 776 [1182] has become an independent human being. Now it is also given a name, which is taken from the animal or vegetable kingdom. The name is given to the father, when he offers his prayers in snuff-powder intoxication, by the gigantic animal and plant spirits living on

/214 cont./

554 him to commit a similar excess. In their traditional duels no one dares to fight with the guapo, for they are afraid that in the heat of the encounter he may lose control of himself and kill [621] his adversary. Apparently there is only one guapo in each local group, and, from what can be seen, he may have the social mission to eliminate the weak elements in the group, in spite 554 of his not realizing that that is his function. It was explained to us, 769 for example, that on occasion the neighboring group is invited to 628 the feast of the dead, when, the ashes reduced to fine powder, [266] they ingest those of their dead companions. This invitation is extended to the enemy group in particular if it is known with certainty that among the dead whose ashes they are about to take there is one who died through the magical intervention of a member of the enemy band. During the ceremony the sablf shaman, before opening the gourd which contains the ashes, points out to the guapo of his group the probable murderer in the opposite band, who, in order to avoid complications, is always the weakest man in the group. The feast proceeds as though nothing had happened, but the enemies who lost the man during the feast invite their adversaries to celebrate the feast of their dead also.

554 Old people, for their part, do not seem to be very safe be- [788] fore this element, /215/ and some Sanemá of the Ventuari ex- [574] plained that the guapo must treat visitors in this way in order to prove his courage. It would be interesting to know in greater detail the function of the Sanemá guapo and to find out whether these are isolated cases or a traditional phenomenon.

●842 The Sanemá believe that the child exists in the father, who passes it to the mother so that it may grow and be born. In 162 the Sanemá communities which we visited on our expedition 855 we were surprised at the small number of children to be found in the settlement. The parents showed much affection for their children, and when these latter have grown somewhat they participate, to the degree that their age and strength allow, in all the activities of the adults.

881 It seems that they are acquainted with rites indicatory of the onset of puberty for a boy or girl. The first menstrual period

Sanema

not only let us take his picture but begged us to take it again, with his wife beside him. Then he caused general merriment by posing beside the 'public woman' who was painted and dolled up like a bird of paradise. In a third take, he stood between the two women, caressing their breasts in an excess of zeal. At this, enthusiasm knew no bounds. Even Uarema's brother, a venerable figure with his head crowned with the scars of old battles, burst into such a vehement laugh that he lost his horrible quid of tobacco. This change of mood enabled us to get on with our job. But our takes were often interrupted, for Uarema had started a vogue and couples would come along and insist on being photographed in their full feather rig.

III

For our forthcoming river trips we were anxious to engage one of Luis Antonio's many brothers, who was apparently of the same age and had the reputation of being the tribe's most experienced traveller. To a certain extent he was even familiar with the Samatari on the other side of the cordillera. But his wife was expecting a child, so that he was prevented from going very far away from home. This seemed to us the most natural thing in the world. The wife was a tiny little lady, her only sign of maturity being her enormous belly, which very clearly did not owe its size to the swelling caused by internal parasites, the privileged possession of these women and children. Without this evidence of pregnancy she might have been taken for a girl of ten.

'The birth will come any day now,' Luis Antonio told us. 'But my brother won't be able to start straight away. He'll have to rest.'

We were reminded of the ritual of childbirth which with a few variations here and there is practised by all the Indians of tropical America. It affects the husbands as well as the wives and at bottom, in its way, contains a certain realism, characteristic of primitive peoples. Like us, they accept the principle of cause and effect and they do not really ascribe the pregnancy to strange half-magic phenomena. They know its cause for what it is—man, and his erotic acts. The effect, for them, is not in the woman herself: she is only a means, a vehicle. The true effect is the child. Up to this point, their attitude is no different from ours. The different point of view comes with the valuation placed by the Indians upon the cause after the effect has been produced. They see the role of

6: Vinci T-5 (1950) 1959 SQ18 Yanoama SQ18
Sanema

842 846 the male as continuing in importance not only after conception—at which stage, in our own positivist scientific view, the male role ceases to count—but for a certain period after the actual birth. The male, the cause, is still in the picture, according to the Indian mind, when the mother and child are living a normal life.

843 844 [128] [115] I had known other native peoples, and in regard to these Indian beliefs on the subject of childbirth, Luis Antonio confirmed what had already come to my knowledge.

[825] 'In order for the birth to be a success,' he told me, 'when the wife is five months gone, the husband should stop eating peccary, snake or *caribe* (the name given in Venezuela to the carnivorous fish known in Brazil as *piranha*), and the flesh of any animal of an aggressive nature.' (Here, principles of hygiene were mingled with elements of magic, as happens also in the more advanced [846] religions.) 'Then, before the birth, during the birth and after, the man must stay in the hammock without stirring, because any strain on his part, or any mishap that came his way, would affect the child and might have dire results.'

[562] The explanation sounds quite normal and natural once one admits the principle of continued causation in the man, the woman being regarded simply as a means. In fact there is no need for her to obey the injunction to stay in the hammock. She will continue her daily round until she feels 'something break inside her'. Then, with the midwife, she will hurry to the appointed place on the river-bank.

*123 844 I once had the chance of being present at a birth. I was with the Taurepan Indians of the Gran Sabana, and I watched hidden behind a cluster of Mauritius palm, where I could follow the principal stages of the proceedings. The woman, with her head tilted back, was seated on the clay bank in a sort of arm-chair shaped hollow which had been scooped out—whether naturally or made for the purpose I do not know. The midwife knelt at her feet, waiting. For some time both remained in this position. The woman kept giving little cries—but not really cries of pain. After a brief labour, the mother uttered one long howl which sounded to me like an 'u . . . u . . . uh' of rapture, and the midwife rose to her feet, holding up a tiny, mottled infant head downwards by the heels.

Still holding the baby by the feet, the old lady washed him in the river—with exactly the motions you might expect from a washerwoman giving the final rinsing to some heavy garment. I couldn't see the next step, but a few

847 [848] child: he had scrupulously observed the coitus taboo during lactation--the wife had not.

Most cases of infanticide take place when a couple already has a small child. Sickness takes a heavy toll during the early months of a child's life, and women are reluctant to jeopardize a child that has already survived the first two years. So, they frequently kill the new-born so that their older child will have no competition for milk. Bahimi, a woman of some 30 years, killed a new male baby shortly after I started my fieldwork in Bisassi-tedi. She explained, tearfully, that she did not feel that she could successfully raise the new child because she still had a son that was nursing.

847 562 162 These cases do not, however, explain why there is a consistent bias to kill females rather than males. When I discovered how significantly the sex ratio diverged from the expected value of 1.0 in some villages, I tried to get an explanation from the Yąnomamö. I was surprised to find out that they were ignorant of their own bias in killing children. [842] What did come to light, however, was the fact that Yąnomamö prefer to have a male baby for their first child and, if it turns out that the first child is a girl, they will frequently kill her. If, however, a couple prefers to have a girl and the first child is a boy, they generally do not kill the boy.[1]

[114] [582] [1]Whatever the reason may be for the preference toward males as eldest children, there is one structural effect that deserves further enquiry. Rose (1960) effectively showed that where males tend to marry females that are younger than them-

When I insisted that she share her food with the child, he ate it ravenously. In short, she was letting the baby die slowly of starvation. I have similar accounts from missionaries who have also witnessed cases such as this.

Male babies are preferred because they will grow up to be warriors and hunters. Most men make known their wishes to have a son—even to the point of insinuating that the wife ought to deliver a male or suffer the consequences. This is always done in a subtle way, usually by displaying signs of anger or resentment at the thought of having a daughter that constantly eats without being potentially an economic asset or guardian of the village. Many women will kill a female baby just to avoid disappointing their husbands. The Yąnomamö also practice abortion in a very crude but effective way. The pregnant woman will lie on her back and have a friend jump on her belly to rupture the amnion. Sometimes abortions are effected because the woman does not want to kill the baby after it is born. In other cases a man will order his wife to abort if he suspects that somebody else conceived the child.

Several techniques are used to kill a newborn child. The most common method is to strangle it with a vine so as not to touch it physically. Another common method is to place a stick across the child's neck and stand on both ends of it until it chokes. In some cases the child is not given the stimulus to breathe and is simply abandoned. Finally, some women throw the child against a tree or on the ground and just abandon it without checking to see if it was killed by the injuries sustained. One of the New Tribes Missionaries discovered a female baby in 1964 that had been discarded in this fashion and brought her home with him. The baby's face was badly bruised on one side, but she survived. The missionary subsequently adopted her legally and is raising her in England.

The demographic result of the Yąnomamö infanticide practices is that there is a shortage of females.[13] This shortage of females, however slight, assumes greater proportions for a number of culturally determined reasons. That is, the shortage of women is even greater than statistics alone imply because of the practice of polygyny and because of taboos relating to sexual intercourse.

The village of Patanowä-teri, for example, has 122 males and only 90 females (see Table 3-3). But many (about 25 percent) of the politically important men in the village have two or more wives. Hence, many men have no wives. Polygyny, therefore, increases the women shortage because the available women are distributed unequally.

In addition to this, the Yąnomamö have taboos against intercourse when a woman is pregnant or is nursing a child. The taboo is by no means followed to the strict letter, since children are nursed for three years or more—some men sheepishly admit having coitus with a lactating wife. Rerebawä, whose youngest child is about a year old, told me that he recently tried to persuade his wife to make love. He added: "She told me to go take some drugs and chant to my forest spirits; she is still 'stingy' with her vagina." Hence there is considerable concern within the village over the acquisition and possession of

[13]The frequency of female infanticide must be considerably higher than the statistics in Table 3-3 imply, since warfare results in the death of more men than women. This shows up in the age and sex distribution: There are more males in the younger age categories than females because of the infanticide preferences. As the males get older, however, they are more liable to death in warfare, resulting in a fairly even distribution of males and females in the thirty- to forty-year age interval. Finally, there are more old women than old men, also reflecting the higher male mortality due to warfare. I have published more substantial data on Yąnomamö demography in Neel and Chagnon, 1968.
